CHAPTER I

GENERAL INSTRUCTIONS

This present special Technical Clauses (CTP) describes the
**THE REHABILITATION OF THE ROAD MATAZEM THROUGH MATAJEM MENKA - MENKA
PALACE (7KM) IN SANTA SUBDIVISION, MEZAM DIVISION OF THE NORTH WEST REGION.**
The various works to be executed are detailed in the localisation of tasks, bill of quantities and the
execution drawings conform to the typical drawings for model plans in the consultation document.

ORIGIN OF MATERIAL

The necessary borrow sites shall be indicated by the supervisor after running identification tests on the materials.

When a borrow site chosen by a contractor is approved, he/she has to carry out sufficient number of samples and run the necessary identification tests which shall be compiled in a single document and submitted to the supervisor for approval. This shall comprise;

- Plan of localisation of the borrow pit
- Thickness of top soil
- The exploitable layer and volume
- Test results on natural moisture
- Test results on sieve analysis
- Test results on atterbergs limits
- Test results on modified proctor
- Test results on CBR

The Contractor can start the exploitation of any identified quarry upon the approval of the Supervisor. This approval can be withdrawn at any time the supervisor deems the borrow pits no longer produce quality material.

LABORATORY

The contractor shall put in place a site laboratory equipped with the necessary equipment and personnel adequate to carry out the necessary tests and studies previewed in this present technical specification

In the case where more than 40% of the works in the contract do not require lab tests, then the contractor can leave from a permanent site lab and negotiate with a private lab of his choice where all his tests will be carried out.

QUALITY OF MATERIAL

FILL MATERIAL

Fill material should be free of organic debris and should be well graded in order to facilitate compaction. This material should have the following minimum characteristics;

- Max grain size $D_{max}=40\text{mm}$
- Plasticity index $IP < 40$
- Percentage of fines $f < 30$
- $CBR > 15$

Therefore, for every 1000m^3 of ordinary fill, the following reception tests shall be carried out;

- 2 Atterbergs limits
- 2 Granulometric analysis
- 2 Modified proctor
- 1 CBR

In swampy areas, substitution material to be used should be material insensible to water, capable of retaining its bearing at saturation and not subjected capillary rise.

Thus, clean sandy laterite of granulometry of 0/6 or all-in aggregates of granulometry of 0/40 should be used.

LATERITE AND SCORIA FOR FILLING

The laterite required to fill the road shall be of selected material. Quality of the laterite shall be special on the work site by the supervisor

CULVERT RINGS

Metallic Culverts used should meet the LCPC SETRA September 1981 standards;

Sheets in carbon sheets, resistant to temperature changes, meet NFA-35-556 standards on HR bolts intended for the construction structures.

Galvanised and hot asphaltting will ensure protection against corrosion. The average layer of zinc deposited should be at least 725g/m^2 on both sides and general mass should be more than 640g/m^2

SAND

The nature and origin of sand shall remain the approval of the supervisor.

Is shall be gotten from a river or through crushing. Sand components should not be more than 80% and very fine constituents eliminated by settling less than 4%

AGGREGATES

They shall be obtained from deposits or quarries chosen by the contractor, and approved by the supervisor.

CEMENT

They should be of CPA 42.5 class and be obtained from an approved factory

STONES

They shall be obtained from a quarry or an approved deposit and not smaller than 20 cm

TIMBER WORKS

The wood use should have the following characteristics;

- should be very hard wood of bulk density at 12% humidity in g/cm^3

PRELIMINARY WORKS

This consist of areas to be cleared, trees to be felled and a width of the cleared area to be deforested,

Positioning of simple numbered markers (wooden pegs) on both sides of the road and beyond the width defined of the earthworks at 50m intervals such as to indicate the centre line of the road and the cross sections

EARTH WORKS

The aim of this works is to transform the existing roadway into a uniform road section 4-6 metres wide, dig triangular ditches 1.5m wide and 0.6m deep in accordance with the model cross-sections.

The earthworks should as much as possible be minimised by fixing the longitudinal profile such as to directly reuse on the road section, all the good materials from the earth works which are accepted by the supervisor.

Special attention should be paid to the slope which should not be less than 4% on both sides of the centre line of the cross section and could reach 8% in the curves.

The compaction required for the road section shall be 95% of the dry modified optimum proctor density. This therefore requires the contractor to scarify existing road if necessary before reshaping it.

REGRADEING AND SHAPING OF EXISTING ROAD.

This has to be carried out with the use of a grader by shaping the road surface to be able to throw off water into the side drains that equally have to be created by the grader.

Off-shoots to evacuate the water away from the sides of the road should be created at regular intervals if the nature of the area permits it.

Where the existing road is wide enough and requires no further earth works, the contactor shall reshape the road using a grader such as to give it a cross section that conforms to the typical drawings, such reshaping must respect the rules; putting of materials in cordons, watering, levelling off and followed by compaction such as not to lose materials. The min degree of compaction is 90% of the modified optimum proctor density. Geotechnical test at an interval of every 500m shall be conducted to determine this density with a reference proctor for every 5km stretch for uniform soil texture.

SURFACE COURSE

Before the execution of the surface course, the contractor shall submit to the National Laboratory "LABOGENIE" Civil Engineering or any other laboratory authorised by the control for approval, a composition of all materials from the possible borrow pits from which laterite to be used for the surface course.

Material from the laterite pits shall be transported from the pit sites to the project site by the use of trucks.

The surface course has to be compacted by the use of a compactor to the standards required by the geotechnical tests carried out on the laterite.
