1. Generalities

These descriptive notes and technical specifications are drawn up for the purpose of execution of this project. A standalone solar photovoltaic lighting system is used for illuminating a building in off-grid area or in absence of grid energy. Recent advances in LED lighting have brought very promising opportunities for application in lighting. Combining LED's low power, high illumination characteristics with current photovoltaic (PV) technology, PV powered lighting utilizing LED has become a norm in many places. In today's application, most of the common High Intensity Discharge (HID) lamps, often High-Pressure Sodium (HPS) lamps are being replaced by more low powered Light Emitting Diode (LED) lamps.

The works shall include especially: Preliminary works include the clearing, cutting, leveling, mobilization, implantation, and planting of work sign post at the work site;

Each solar installation shall include the following basic solar-powered components:

- Solar Panel or Photovoltaic Module
- Lighting Fixture – LED lamp set
- Rechargeable lithium ions Battery
- Solar Charge Controller
- and Interconnecting cables.

The contractor in charge of this execution must make careful studies of the working drawings. Visit the site and bring up points not understood to the site supervisor for a clarification before making shop drawings and before setting out is carried out.

He will proceed to a careful study of the project and make observations and furnished modifications to the Architect before commencement of work. All supplementary tasks must be verified and signed by the supervisor. Careful studies must be done before commencement of foundation.

Preliminary works

Building Site Installations

The contractor shall set up temporary constructions and facilities needed to execute the works, such as:

- Offices of the Contractor equipped with tables, chairs and lock-up cupboards.
- Building site toilet facility (if it does not exist)
- Storehouse for materials

The Solar Panel will provide electricity to charge the battery during day time. The battery's charging is controlled by a charge controller. The operation of the LED bulb is controlled by a control circuit either by using sensors such as Light Dependent Resistor (LDR) or voltage or current sensor. The solar panel is mounted at the top of the roof of the bulding to minimize the possibility of any shading on the panels.

2. Description of basic components of solar street light system:

Solar panel

A Solar Panel is basically a module that converts light energy (photons) from the sun to generate electricity in direct current (DC) form.

550Wc Mono-crystalline Solar Panel

Battery

Batteries are used to store the electricity generated by the solar panel. During the day, electricity generated by the solar panels is supplied to the battery and/or the load. When the load demand is higher than the energy received from the solar panels, these batteries will provide stable energy to the load. Solar power applications typically use deep-cycle batteries because they can persist repeated and deep discharges.

Lithium-Ion (Li)

Lithium batteries Pack of 15KWH Energy300Ah 24 V considered the future of batteries used in solar powered systems. This is due to a number of factors such as high specific energy, high DOD, and higher number of charging cycles. However, due to its higher cost compared to other type of batteries.

1 Defining of packages:

The packages have been defined based on the power load of the health center concern. The package will be selected based on the equipments.

Type	Minimum Solar PV Module Size (Wp)	Minimum Battery Size for Lithium Ion (AH)	Power Hybrid Inverter Size (W)
Capacity	550Wc	15KWH/300A	10KW
